Key Questions and Answers for Rat Dissection

Understanding common questions helps reinforce learning and prepares students for assessments.

Q1: How do you distinguish between the small and large intestine?

Answer: The small intestine is longer, more coiled, and has a narrow lumen, while the large intestine is shorter, wider, and has a more distinct lumen. The large intestine also contains the cecum, which appears as a sac-like structure at the junction with the small intestine.

Q2: What is the function of the liver in the rat?

Answer: The liver produces bile, which aids in digestion of fats, detoxifies harmful substances, stores glycogen, and regulates blood glucose levels.

Q3: How can you identify the rat's heart during dissection?

Answer: The rat's heart is located in the thoracic cavity, between the lungs, and has a muscular, four-chambered structure. It appears as a reddish, conical organ with visible arteries and veins attached.

Q4: What are the main differences between rat and human respiratory systems?

Answer: While both have similar structures like trachea, bronchi, and lungs, rats have a more elongated nasal cavity and different respiratory rates. The basic architecture is comparable, making rats a good model for respiratory studies.

Q5: Why is the diaphragm important in the rat's respiratory system?

Answer: The diaphragm is a muscular sheet that contracts and relaxes to change the volume of the thoracic cavity, enabling the rat to breathe by drawing air into and expelling air from the lungs.
