 - d) Pus formation
- Answer: b) Bleeding on probing

Case-Based Question

A 35-year-old patient presents with swollen, bleeding gums and a pocket depth of 6 mm on the mandibular molars. Radiographs reveal horizontal bone loss. What is the most probable diagnosis, and what initial therapy would you recommend?

Answer: The most probable diagnosis is chronic periodontitis. Initial therapy includes non-surgical periodontal therapy such as scaling and root planing, along with oral hygiene instructions and risk factor modification.

Essay Question

Discuss the role of host immune response in the progression of periodontal disease. Include in your answer the balance between microbial virulence factors and host defense mechanisms.

Sample Answer: The progression of periodontal disease is influenced by the interaction between pathogenic microbes and the host's immune response. The host immune system attempts to contain microbial invasion through inflammatory responses, involving cytokines, antibodies, and cellular defenses. However, an exaggerated or dysregulated immune response can lead to tissue destruction, including alveolar bone loss. Understanding this interplay is crucial for developing targeted therapeutic strategies.
