principles:

- Determination of Coefficient of Viscosity of a Liquid

Objective: To measure the viscosity of a liquid using a viscometer.

Theory: Based on Poiseuille's law, the flow rate of a viscous fluid through a capillary tube is proportional to the pressure difference and inversely proportional to viscosity.

Procedure:

- Use a capillary viscometer (like Ostwald viscometer).

- Verification of Bernoulli's Theorem

Objective: To demonstrate the relationship between pressure, velocity, and height in a flowing fluid.

Theory: Bernoulli's principle states that in a steady, incompressible, non-viscous flow, the sum of pressure energy, kinetic energy, and potential energy remains constant along a streamline.

Procedure:

- Set up a horizontal pipe with two different sections of varying diameters.
- Measure the flow velocity at both sections using a Venturi meter or flow tube.

- $Re > 4000$: Turbulent flow

Procedure:

- Use a transparent pipe or flow visualization setup.
- Vary flow velocity by adjusting the pump or flow source.
