QuestionAnswer What is the Pythagoras theorem and how is it applied in 9th standard geometry? The Pythagoras theorem states that in a right-angled triangle, the square of the hypotenuse is equal to the sum of the squares of the other two sides. It is applied to find the length of sides in right-angled triangles and solve problems involving distances and heights. How do you find the area of a triangle using Heron's formula? Heron's formula states that the area of a triangle with sides a , b , and c is $\sqrt{s(s-a)(s-b)(s-c)}$, where s is the semi-perimeter $(a+b+c)/2$. It is used when the lengths of all three sides are known. What are similar triangles and how can they be identified in problems? Similar triangles are triangles with the same shape but different sizes, having corresponding angles equal and sides proportional. They can be identified using criteria like AA (angle-angle), SAS (side-angle-side), and SSS (side-side-side). What is the importance of the centroid in a triangle, and how is it found? The centroid is the point where the three medians of a triangle intersect. It is the center of mass and divides each median in a 2:1 ratio. It can be found by averaging the coordinates of the vertices or by constructing the medians. How do you prove that the sum of interior angles of a triangle is 180 degrees? One common proof involves drawing a parallel line through one vertex parallel to the opposite side, then using alternate interior angles and the straight angle to show that the sum of the three interior angles is 180 degrees. What is the significance of the similarity ratio in solving geometry problems? The similarity ratio (or scale factor) helps relate corresponding sides of similar triangles, enabling the calculation of unknown lengths, areas, or heights based on known measurements. How can coordinate geometry be used to find the distance between two points in 9th standard geometry? The distance between two points (x_1, y_1) and (x_2, y_2) can be found using the distance formula: $\sqrt{(x_2 - x_1)^2 + (y_2 - y_1)^2}$, derived from the Pythagoras theorem.
