Differential Equations and Boundary Conditions

Bakshi employed partial differential equations (PDEs) to describe the behavior of fields in space and time. These include wave equations derived from Maxwell's equations, adapted for specific media and boundary conditions.

Green's Functions and Integral Methods

A significant contribution was Bakshi's use of Green's functions to solve boundary value problems, especially in irregular geometries. This method simplifies complex PDEs into integral equations, facilitating numerical solutions.

Spectral Analysis and Fourier Techniques

Bakshi extensively utilized spectral analysis to understand frequency-dependent behavior of fields, crucial for designing systems like filters and resonators.

Numerical Methods and Computational Electromagnetics

Recognizing the importance of computational tools, Bakshi contributed to the development of numerical algorithms such as the finite element method (FEM) and finite difference time domain (FDTD). These methods allow engineers to simulate electromagnetic phenomena with high precision, essential for modern device design.
